

INTERNAL ENGINEERING BRIEF

Administrator Verification Module

A tokenized administrator portal that turns the manager's prior representations into **prepopulated, confirmable prompts** and captures exceptions inside the engagement record.

STATUS

For Build

SECTION 01 / OBJECTIVE

What this module is

An independent confirmation layer that closes the loop between manager representation and administrator record.

Build a tokenized administrator portal that captures independent confirmation from the fund administrator on a defined set of operational and accounting matters, scoped to the strategy of the underlying fund and prepopulated with the manager's prior representations from the ingested documentation set.

The output of this module feeds directly into the administrator verification section of the final Operational Due Diligence report and into the engagement exception register.

SECTION 02 / ACCESS AND AUTHENTICATION

How the portal is reached

Each engagement generates a unique signed token mapped to a single portal session. The token is delivered to the verified administrator contact captured at the manager intake stage. Tokens are bound to one fund, expire after a configurable window (default 14 calendar days), and require email based verification on first access. All responses are timestamped, IP logged, and tied to the responding contact identity for audit trail purposes.

SECTION 03 / CORE REQUIREMENT

Question generation from prior representations

The central design point. Open ended prompts are not used.

For each item, the engine pulls the manager's prior representation from the ingested documentation (DDQ, LPA, side letters, operations memo, valuation policy, AML manual, prior NAV packs) and renders that representation as the anchor of the question. The administrator is then asked to confirm, qualify, or correct.

EXAMPLE PROMPT

The Manager has represented that cash transfers above \$500,000 require dual approval from the CFO and COO, with countersignature by the administrator prior to release. Please confirm whether the controls currently in place align with this representation. If they do not, please describe the actual control.

The engine should template these prompts by extracting the claim components (subject, control, threshold, counterparty, frequency) from the source documentation and substituting them into a fixed institutional question shell. Where no prior representation exists for a given line item, the engine falls back to a standard baseline prompt.

SECTION 04 / QUESTION SCOPE PER ENGAGEMENT

What the portal asks

Ten categories. Six baseline, two additional baseline, one conditional on file status, one strategy gated.

BASELINE QUESTIONS / FIRE ON EVERY ENGAGEMENT

01

AUM Confirmation

Confirmation of AUM as of the reporting date and the prior period, with variance flag against the manager reported figure.

02

Investor Account Count

Confirmation of the number of investor accounts on record.

03

NAV Errors (24 months)

Disclosure of NAV errors, restatements, and corrections in the prior 24 months.

04

Fee Calculation

Confirmation of management fee, performance fee, hurdle, high water mark, crystallization frequency, and any side letter departures.

05

Reporting Timeliness

Confirmation of reporting frequency, target delivery window, and exceptions in the prior 12 months.

06

AML and KYC Procedures

Confirmation of procedures applied to new investors and to ongoing monitoring.

ADDITIONAL BASELINE / FIRE ON EVERY ENGAGEMENT

07

Valuation Involvement

Confirmation of the administrator's role in pricing the portfolio, including independence of pricing sources, override authority and frequency, escalation procedure, and treatment of Level 2 and Level 3 assets per the manager's stated valuation policy.

08

Cash Controls

Confirmation of the administrator's role across three distinct flows, presented as separate sub items so the response is captured per flow.

(a) Investment cash movements. Subscriptions, redemptions, capital calls, distributions, trade settlement.

(b) Operating expense disbursements. Fund level expenses, manager reimbursements, vendor payments.

(c) Investor capital flows. Subscription receipts, redemption payments, transfers between vehicles.

For each flow, the engine surfaces the manager's described control (signatory matrix, approval threshold, dual control) and asks the administrator to confirm or correct.

09

SOC 1 / SOC 2 Attestation

Conditional on file status. The portal first checks whether a current SOC 1 Type II or SOC 2 Type II report is held against the administrator entity in the Alpine library. Where a current report is on file, the question is suppressed. Where no current report is on file, the administrator is asked to upload the most recent report covering the engagement period.

NDA ACCOMMODATION / EMBEDDED IN ITEM 09

The upload field is paired with a secondary control: an **Upload NDA for Alpine countersignature** option. Where the administrator requires an executed mutual NDA prior to releasing the SOC report, they upload their NDA template directly through the portal. The submission routes to Allen for review and counter execution, and the engagement record is flagged as awaiting NDA execution. Once executed, Alpine returns the signed copy through the same portal thread and the SOC upload field is reactivated. This avoids forcing the back and forth into email and keeps the chain of custody inside the engagement record.

STRATEGY CONDITIONAL QUESTIONS

10

Asset Existence

Fires only where the administrator holds a custody, depositary, or read access role appropriate to the strategy. Question template varies by strategy.

- Long/short equity and other liquid strategies route through prime broker statement reconciliation.
- Private credit and private equity route through underlying loan documentation or equity certificate confirmation.
- Macro and managed futures route through FCM and clearing broker confirmation.
- Digital assets route through qualified custodian wallet attestation.

The engine determines applicable strategy logic from the strategy classification captured at the manager intake stage and skips the question entirely where the administrator has no asset existence role.

SECTION 05 / RESPONSE MODEL

Four options per question

Confirm	The manager representation matches administrator records. No further input required.
Confirm with caveat	Free text required. Auto routed to the engagement exception register.
Decline to confirm	Reason code required: outside engagement scope, confidentiality, no records on file, other.
Contradict	Free text required. Routed to the exception register with a red flag and an automatic notification to the lead analyst.

SECTION 06 / DOCUMENT ATTACHMENT

Evidence capture per question

Each question carries an optional document upload field. The administrator can attach supporting evidence (SOC 1 or SOC 2 report, AUM letter, sample NAV statement, signatory matrix, custody statement, AML policy). Uploads are stored against the engagement and tagged to the question they support. The SOC question carries the additional NDA upload control described in item 09.

SECTION 07 / OUTPUTS

What the engine writes

On submission, the engine writes a structured record per question containing the claim text, the administrator response, the response category, any supporting document references, the timestamp, and the responding contact identity. This record feeds directly into the administrator verification section of the final ODD report and into the exception register where applicable. The administrator receives a signed PDF acknowledgement of the submission for their records.

SECTION 08 / BUILD SEQUENCING

Four phases to first engagement use

PHASE 1

Token Issuance and Baseline

SPRINT 01

PARITY BUILD

Token issuance, baseline questions 01 through 06, confirm or override response model. Brings the portal to parity with the current UI.

PHASE 2

Claim Extraction Engine

PRIORITY

SPRINT 02 TO 03

Manager claim extraction and prepopulated question generation. Priority work item and the differentiator versus a generic vendor questionnaire.

PHASE 3

Strategy Logic and SOC Flow

SPRINT 04

CONDITIONAL LAYER

Strategy conditional logic for asset existence, expanded valuation and cash control modules, SOC attestation logic with NDA accommodation flow.

PHASE 4

Register and Acknowledgement

SPRINT 05

CLOSING LAYER

Document upload register, exception register integration, deal team alerting layer, and signed PDF acknowledgement issuance.

SECTION 09 / OPEN ITEMS FOR ENGINEERING SCOPING

Decisions to land before kickoff

Confidence threshold on claim extraction

The manager claim extraction step in Phase 2 requires a confidence threshold. Where the engine extracts a claim with low confidence, the prompt must fall through to the baseline phrasing rather than risk presenting a malformed claim to the administrator. A malformed prepopulated question damages the credibility of the portal on first contact and is worse than a generic baseline prompt.

Identity capture on response

The response model must record the signing identity at the legal entity level: administrator firm name, contact name, title, email, IP address, and timestamp. This becomes the audit chain for any contradiction the engine surfaces in the final report, and it protects Alpine on the evidentiary side if a manager later disputes a flagged exception.

NDA template handling

For the SOC attestation flow, decide at scoping whether the inbound NDA is parsed and counter executed inside the platform or routed out to a third party signing tool. A first pass implementation can use a manual review queue with email based execution, provided the executed copy is uploaded back into the engagement record so the chain of custody is preserved.

Suppression rules for SOC

Define the staleness window for SOC reports held in the Alpine library. Default proposal: a SOC 1 Type II or SOC 2 Type II is treated as current if the report period end is within the last 15 months. Outside that window, the question fires regardless of whether a prior report exists in the library.

SECTION 10 / ACCEPTANCE CRITERIA

When the module is ready

The module is considered complete and ready for first engagement use when the following are demonstrably true:

- 01** A token issued against a test engagement opens a portal session bound to that engagement only, with a working expiry and a verified email gate.
- 02** All ten question categories render correctly, with prepopulated phrasing where prior representations exist in the ingested documentation.
- 03** The four option response model writes a structured record per question and routes contradictions and caveats to the exception register without manual intervention.
- 04** The SOC 1 / SOC 2 logic correctly suppresses the question when a current report is on file and surfaces the NDA upload control when an administrator indicates one is required.
- 05** A signed PDF acknowledgement is issued to the responding administrator contact on submission, with the engagement record stamped accordingly.
